

NOTE 21 - TREE PRESERVATION TECHNIQUES

1. The preservation of existing trees on a development site shall be a primary component of the landscape plan submitted for that project.

The enclosed drawings indicate the methods to be incorporated for protecting designated trees during and after construction.

The developer shall clearly mark on the site plan and landscape plan trees which are to be preserved.

The developer shall mark trees to be preserved on the site with blaze orange engineering tape on the trunk. Snow fencing shall be placed around the trees to be preserved prior to clearing and grading the site. Snow fencing shall be placed at the canopy drip line or six feet (6 ft.) from the tree trunk, whichever is greater, in order to minimize damage to the tree root system.
